## RBE(H) Series Motors

Data  
Publication

The RBE series brushless motors provide a wide range of flexible motor solutions for frameless DDR (Direct Drive Rotary) motor applications.

- 10 frame sizes from 21.3mm to 239mm outside diameter
- Continuous Torque range from .01Nm to 38Nm
- Peak Torque range from .03Nm to 200Nm
- Speeds up to 35,000rpm
- Standard and custom windings to match speed/torque performance

These motors come in either housed (RBEH) or frameless (RBE) mechanical configurations. The Housed models come with stainless steel shafts and can include any combination of Hall sensors, encoder, or resolver as rotor position feedback devices.

The frameless configuration is supplied as two separate components (rotor and stator) and does not include a shaft, bearings, or endbells. Frameless motors are integrated directly with the load where the same bearings which support the load also support the motor. This configuration eliminates shaft, bearings, endbells, and couplings offering reduced volume, weight, complexity and also results in improved servo stiffness and quicker response. Frameless motors can include integral Hall sensors and additional position feedback devices such as encoders or resolvers would be added as separate components.

### Advantages of Brushless Systems

Brushless systems offer distinct mechanical advantages over conventional systems. Placement of brushless windings into the outer stationary member and field magnets onto the inner rotating member allows significant reductions in rotor inertia and increases in acceleration. Winding heat can be transferred directly from the outer member into adjacent heat sinks. Cooling and efficiency are improved. Generally, brushless systems can provide extra performance while surviving a great variety of operating conditions and offer improved efficiency and heat dissipation. Kollmorgen's brushless motors are available frameless or housed and are easily matched with Kollmorgen servo amplifiers. As new technologies emerge, Kollmorgen will continue providing the very finest motion control system components.

### Brushless Motor System Components

There are four basic components in a brushless motor drive system. They are the Armature, the Field, the Rotor Position Feedback and the Servo Amplifier.

#### The Armature

The armature is the wound member of the motor and consists of a three phase windings wound on a laminated iron core. The armature is the outer member and is stationary. It consists of low loss laminations bonded into a core which may have skewed winding slots. The core and slots are electrically insulated prior to inserting the winding. The winding consists of series of coils for each motor phase. Phase interconnections are made inside the winding, resulting in a "wye" or "delta" connection. With a three wire termination, there is no reason for the customer to require either a "wye" or "delta" internal connection. Three leads are typically brought out for connection to the amplifier.

#### The Field

The field assembly or rotor typically consists of permanent magnet poles bonded to a flux carrying yoke ring. The magnet material selected will depend upon the application. Available magnet materials include Samarium Cobalt and the new high energy Neodymium-Iron-Boron compounds. For high speed applications, a magnet retaining band can be placed around the rotor to insure mechanical integrity.

#### Rotor Position Feedback

High performance Brushless DC systems require rotor position feedback to the amplifier to perform the commutation function, which is required for the Brushless DC motor to rotate. Kollmorgen Brushless DC motor systems typically will include one of the following rotor feedback configurations: Hall sensors, encoder, or resolver. Hall sensors have the advantage that they are an integral part of the Armature and therefore do not require the customer to integrate a separate feedback device. For frameless motor applications which require a resolver or encoder, the customer will often need to add these as separate components in their system.

#### Servo Amplifier

The servo amplifier is required for a brushless motor to rotate. The servo amplifier acquires the rotor position feedback. This information is used to direct current into the appropriate windings of the Armature to develop torque. As the Rotor rotates, the Servo Amplifier uses the Rotor Position Feedback to redirect the current into a different winding phase, as necessary to continue to generate torque as the rotor rotates. The Servo amplifier will typically close an internal current loop. Optionally, the Servo amplifier can use the Rotor Position Feedback to control the velocity and / or the position of the motor.

## INTRODUCTION

### Frameless vs. Housed

Kollmorgen brushless motors can be supplied either frameless or housed. A housed motor includes a shaft, bearings, and endbells along with any feedback devices, into an integral assembly. This is the classical motor configuration. The customer mounts the motor housing into the desired system and provides a mechanical coupling to the motor shaft. The coupling can be a direct shaft coupling, gearing, or belts / pulleys. In many applications, the customer mounts the load directly to the motor shaft with the motor bearings supporting the load. Frameless motors are supplied as two separate components; the Rotor (Field) and Stator (Armature). The Frameless motor does not include shaft, bearings, or endbells. Frameless motors are used in applications where the customer desires to minimize the size and weight of the motor and / or obtain the maximum dynamic performance. Since the load is often supported on its own bearing structure, the Frameless motor can be integrated directly onto the system / load shaft and be suspended on the same bearings as the load.

This eliminates the need for an additional shaft, bearings, endbells, and any coupling between the motor shaft and the load. An advantage of Frameless motors is that, since there is no coupling between the shaft and the load, torsional play between the motor and load is minimized resulting in improved dynamic performance. Another advantage of Frameless motors is that inertia matching between the motor and load, which is typically required for housed motor applications, is not a critical requirement for Frameless motor applications, since the motor and load are one inertial mass.

### System Performance and Communication

Careful selection of system components optimizes brushless system performance. Kollmorgen offers brushless components for two kinds of brushless systems: six step (trapezoidal) and sinusoidal. Selection should be made based on the application and on the performance requirements. For most servo applications, a six step sequence is appropriate unless very smooth operation under load at slow speed is required. For such applications, sinusoidal amplifiers with selected brushless motors offer exceptionally smooth operation with low torque ripple.

Brushless motors are not commutated mechanically, such as with a commutator and brushes, but electronically based on rotor magnet position information. Kollmorgen six step amplifiers are designed to utilize Hall device position signals for commutation. Hall devices mounted onto the stator convey rotor magnet position to the amplifier. This position information is necessary for commutation which changes the direction of current flow in the proper motor windings at the proper time. The Hall devices are accurately aligned with the stator winding back EMF at the factory on all motors supplied with Hall devices.

The Hall device and Motor Phase Output diagram shows proper alignment of the three Hall device outputs with the three motor back EMF waveforms. Externally rotating the motor field generates a back EMF voltage in each phase, which is used to align the Hall sensor in the optimum position. Current supplied to each phase will correspond with the Hall device switching points.

External motor phase connections are labeled A, B, and C, “V-AB” refers to the back EMF voltage produced across leads A and B. “V-BC” and “V-CA” denote voltages produced across leads B and C and across C and A respectively. Corresponding Hall device outputs are labeled “H-AB”, “H-BC”, and “H-CA”.

Kollmorgen sinusoidal amplifiers are designed to utilize resolver or encoder / Hall sensor position information for commutation. This feedback may be customer supplied or factory supplied for housed brushless motors. Feedback selection will vary depending on the motor selected and the application. Motor selection for a sinusoidal system may require factory consultation to assure performance goals are met. Although six step commutation systems can provide torque with ripple as low as five or six percent, sinusoidal system torque ripple can approach values of one percent. Amplifiers for both system types are pulse width modulated.

## INTRODUCTION

### Motor Parameters

Motor parameters are listed on the individual data page for each motor. These parameters are dependent upon the size and shape of the model, but are independent of the winding used. Following is a brief description of the motor parameters.

**Maximum Continuous Output Power at 25°C Ambient (HP Rated).** This is the maximum continuous power output based on a 130°C temperature rise and a standard aluminum heat sink. (Standard heat sink size is listed just above the continuous performance curves). The maximum continuous power output can be increased if additional cooling is provided.

**Speed at Rated Power (N Rated)** is the speed at which the maximum continuous power is output.

**Maximum Mechanical Speed (N Max)** is the maximum speed which will not compromise rotor integrity.

**Continuous Stall Torque at 25°C Ambient (Tc)** is the maximum constant torque without rotation resulting in a steady state winding temperature rise of 130°C with the standard aluminum heat sink. The size of the standard heat sink is listed above the continuous performance curve for each RBE(H) series. The continuous stall torque can be increased if additional cooling is provided.

**Peak Torque (Tp)** is the maximum torque available from a given size of motor and is the torque the motor will provide when peak current **I<sub>p</sub>** is provided. Peak torque is based on the maximum current density in the winding and is available for a maximum duration of 10 seconds.

**Maximum Torque for Linear K<sub>T</sub> (T<sub>sl</sub>)** is the maximum torque for which **K<sub>T</sub>** will be greater than 90 percent of **K<sub>T</sub>** at low torque. As the torque increases above **T<sub>sl</sub>**, **K<sub>T</sub>** will drop below 90 percent of **K<sub>T</sub>** at low torque and an incremental increase in current will yield a reduced increase in torque.

**Motor Constant (K<sub>m</sub>)** is the ratio of peak torque to the square root of power input at 25°C and at stall:

$$K_m = T_p / (P_p)^{.5}$$

This ratio is useful during the initial selection of a motor, because it indicates the ability of a motor to convert electrical power into torque. A common use of **K<sub>m</sub>** is to determine how much power a motor will dissipate in order to generate a certain amount of torque by using the following equation:

$$\text{Watts Dissipated} = \text{Torque}^2 / K_m^2$$

**Thermal Resistance (R<sub>th</sub>)** is the ratio of winding temperature rise to average power losses continuously dissipated from the stator. Motor **R<sub>th</sub>** values assume a standard aluminum heat sink which is specified above the continuous speed torque curve for each RBE(H) series. Customer supplied supplemental cooling can reduce the **R<sub>th</sub>** value significantly resulting in increased continuous speed and torque operation.

**Viscous Damping (F<sub>i</sub>)** is the torque loss due to rotational losses, mostly eddy current, which is proportional to speed. A lower **F<sub>i</sub>** indicates less loss during high speed operation.

**Maximum Static Friction (T<sub>f</sub>)** is the sum of the retarding torques at start-up or at stall within the motor. In a frameless brushless motor, retarding torques consist of magnetic frictional torque and cogging torque. Housed motor **T<sub>f</sub>** includes bearing and other retarding torques.

**Maximum Cogging Torque (T<sub>cog</sub>)** is a torque disturbance based on the magnets in the field attraction to the teeth in the armature. Cogging torque is minimized in the motor design by strategic selection of slot / pole combinations and by skewing the laminations in the armature.

**Number of Poles (P)** is the number of magnetic poles in the field. The electrical cycles per revolution is equal to the number of poles to the number of poles divided by 2.

### Winding Constants

There are six parameters, or winding constants, listed on the individual data page for each motor which vary according to the winding that is used in the model. The variations are governed by the number of wire turns per coil and the wire size. In some cases, values for more than one winding are listed. If none of the specified windings are suitable for a given application, additional windings are available by consulting the factory. Following is a brief description of each parameter.

**Current at Continuous Torque** ( $I_c$ ) is the current required to obtain the nominal continuous torque from the motor with a nominal torque sensitivity  $K_t$ .

**Current at Peak Torque** ( $I_p$ ) is the current required to obtain the nominal peak torque from the motor. At  $I_p$ ,  $K_t$  will be reduced from the published  $K_t$  because  $K_t$  is reduced at torque above  $T_{sl}$ .  $I_p$  is based on the maximum current density in the winding and is available for a maximum duration of 10 seconds.

**Torque Sensitivity** ( $K_t$ ) is the ratio of the developed torque to winding input current for the designated winding.

**Back EMF Constant** ( $K_b$ ) is the ratio of voltage generated in the winding to the speed of the rotor. Since both  $K_b$  and  $K_t$  are determined by the same factors,  $K_b$  is directly proportional to  $K_t$ .

**Motor Resistance** ( $R_m$ ) is the resistance measured between any two leads of the winding at 25°C.

**Motor Inductance** ( $L_m$ ) is the winding inductance measured between any two leads of the winding. Factory tests are performed at 60 Hz with the rotor in place.

### Continuous Duty Capability for 130°C Rise — RBE - 00710 Series

# RBE(H) Motor Series

## DIMENSIONS

### RBE-0071X-X00

Dimensions in mm (inches).  
Product designed in inches.

Metric conversions provided for reference only.

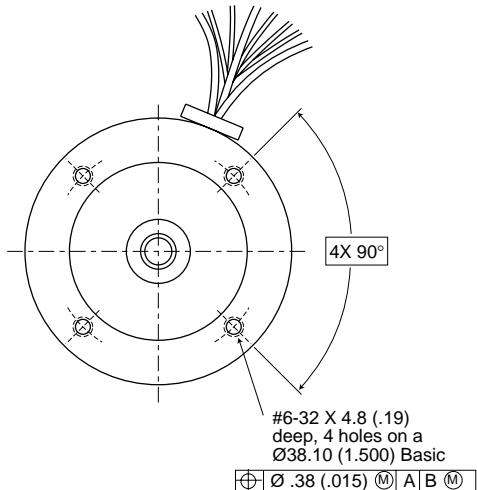

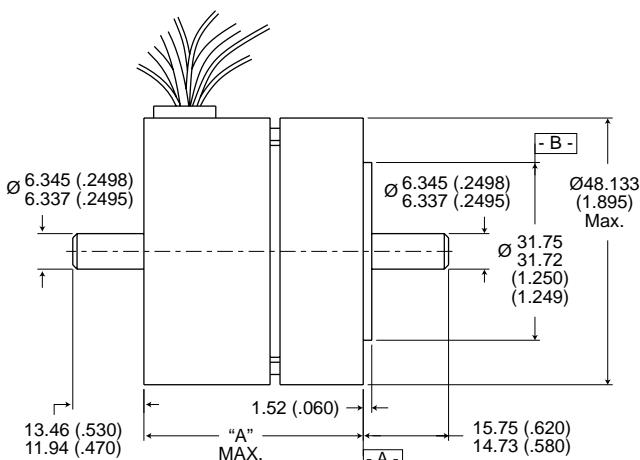

#### Notes:

- 1) For a C.W. rotation, as viewed from lead end, energize per excitation sequence table.
- 2) V-AB, V-BC and V-CA is back EMF of motor phases AB, BC and CA respectively, aligned with sensor output as shown for C.W. rotation only.
- 3) Mounting surface is between Ø 35.81 (1.410) and Ø 37.80 (1.488) on both sides.

MODEL NUMBER	RBE-00710	RBE-00711	RBE-00712	RBE-00713	RBE-00714
"A" Dimension	6.35 (0.250)	12.7 (0.500)	19.05 (0.750)	25.4 (1.000)	33.02 (1.300)
"B" Dimension	12.7 (0.500)	19.05 (0.750)	25.40 (1.000)	31.75 (1.250)	39.37 (1.550)

Tolerance ± .010 on "A" Dimension.

### RBEH-0071X-X00

#### Notes:

- 1) Shaft end play: with a 6 lb reversing load, the axial displacement shall be .013-.15 (.0005-.006).
- 2) For a C.C.W. rotation, as viewed from pilot end, energize per excitation sequence table.
- 3) V-AB, V-BC and V-CA is back EMF of motor phases AB, BC and CA respectively, aligned with sensor output as shown for C.C.W. rotation only.

Dimensions in mm (inches).  
Product designed in inches.

Metric conversions provided for reference only.

### RBEH-0151X-X00

Dimensions in mm (inches).  
Product designed in inches.

Metric conversions provided for reference only.

Notes:

- Shaft end play: with a 11 lb reversing load, the axial displacement shall be .013-.15 (.0005-.006).
- For a C.C.W. rotation, as viewed from pilot end, energize per excitation sequence table.
- V-AB, V-BC and V-CA is back EMF of motor phases AB, BC and CA respectively, aligned with sensor output as shown for C.C.W. rotation only.

### Continuous Duty Capability for 130°C Rise — RBE - 01810 Series

# RBE(H) Motor Series

## DIMENSIONS

### RBE-0181X-X00

Dimensions in mm (inches).  
Product designed in inches.

Metric conversions provided for reference only.

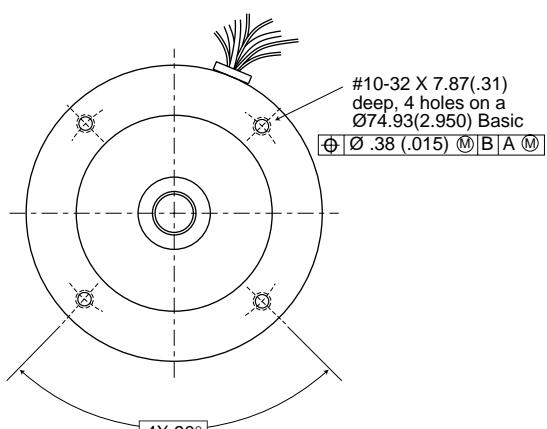

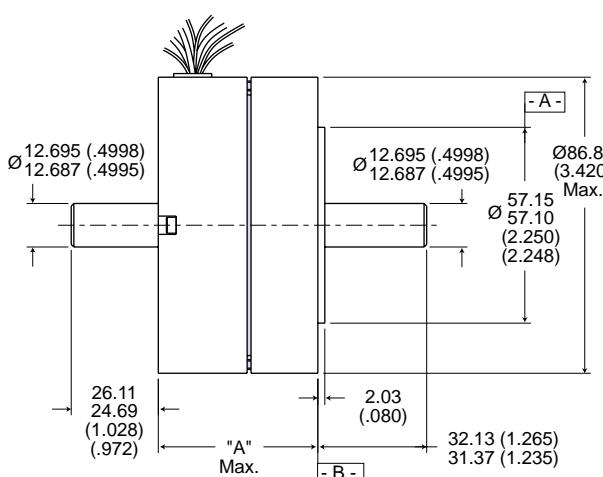

#### Notes:

- For a C.W. rotation, as viewed from lead end, energize per excitation sequence table.
- V-AB, V-BC and V-CA is back EMF of motor phases AB, BC and CA respectively, aligned with sensor output as shown for C.W. rotation only.
- Mounting surface is between Ø 74.68 (2.940) and Ø 75.95 (2.990) on both sides.

MODEL NUMBER	RBE-01810	RBE-01811	RBE-01812	RBE-01813	RBE-01814	RBE-01815

Tolerance ±.010 on "A" Dimension.

### RBEH-0181X-X00

Dimensions in mm (inches).

Product designed in inches.

Metric conversions provided for reference only.

#### Notes:

- Shaft end play: with a 9 lb reversing load, the axial displacement shall be .013-.15 (.0005-.006).
- For a C.C.W. rotation, as viewed from pilot end, energize per excitation sequence table.
- V-AB, V-BC and V-CA is back EMF of motor phases AB, BC and CA respectively, aligned with sensor output as shown for C.C.W. rotation only.

### Continuous Duty Capability for 130°C Rise — RBE - 03010 Series

# RBE(H) Motor Series

## DIMENSIONS

### RBE-0301X-X00

Dimensions in mm (inches).

Product designed in inches.

Metric conversions provided for reference only.

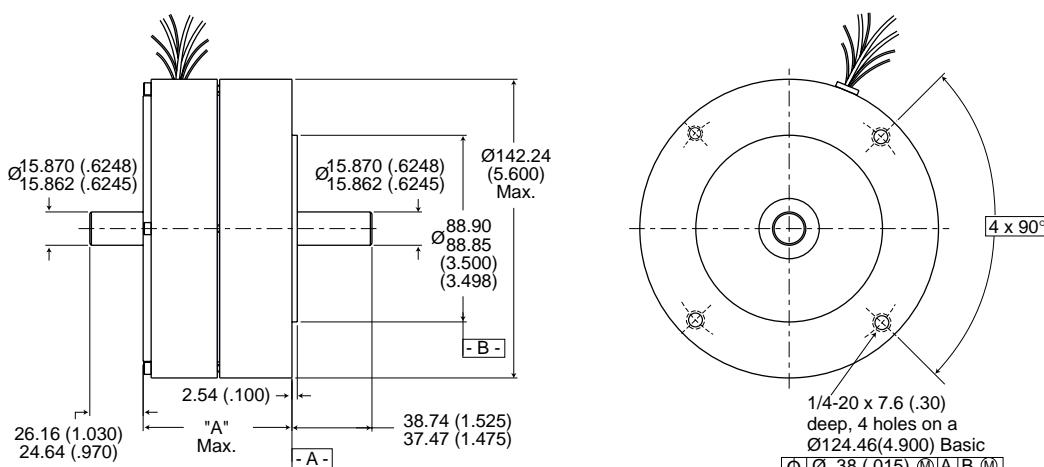

Notes:

- 1) For a C.W. rotation, as viewed from lead end, energize per excitation sequence table.
- 2) V-AB, V-BC and V-CA is back EMF of motor phases AB, BC and CA respectively, aligned with sensor output as shown for C.W. rotation only.
- 3) Mounting surface is between Ø 124.97 (4.920) and Ø 128.91 (5.075) on both sides.

MODEL NUMBER	RBE-03010	RBE-03011	RBE-03012	RBE-03013	RBE-03014	RBE-03015	RBE-03016

OPTIONS — RBEH-0071X

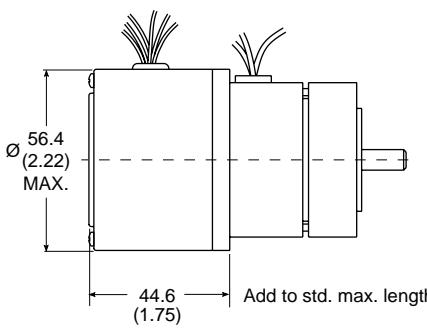

Dimensions in mm (inches).  
Product designed in inches.  
Metric conversions provided for reference only.

## BRAKE OPTION

An integral electromagnetic fail-safe brake can be added to the rear of the motor. Operating in the POWER OFF/BRAKE ON mode, the brake provides 48 oz-in of torque for static parking and emergency braking. To release the brake, 24 VDC and 0.13 Amps max need to be applied.

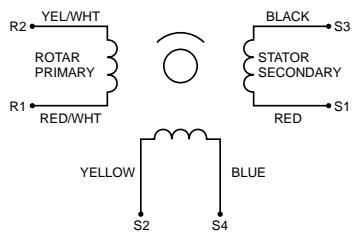

- Fail-safe brake
- 48 oz-in holding torque
- Release voltage of 24 VDC (0.13 Amps)

Dimensions in mm (inches).  
Product designed in inches.  
Metric conversions provided for reference only.

## RESOLVER OPTION

A frameless resolver is available to provide position feedback computable with a wide variety of CNC and other position loop controllers. This option is required for commutation when using SERVOSTAR or other resolver based controller.

### RESOLVER SCHEMATIC

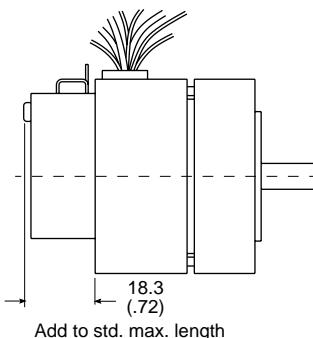

PHASING EQUATIONS  
 $E(S1-S3) = KE(R1-R2) \cos \theta$   
 $E(S2-S4) = -KE(R1-R2) \sin \theta$

An integral electromagnetic fail-safe brake can be added to the rear of the motor. Operating in the POWER OFF/BRAKE ON mode, the brake provides 240 oz-in of torque for static parking and emergency braking. To release the brake, 24 VDC and 0.30 Amps max need to be applied.

- Fail-safe brake
- 240 oz-in holding torque
- Release voltage of 24 VDC (0.30 Amps)

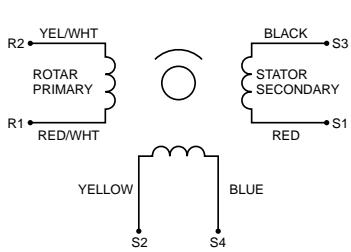

Dimensions in mm (inches).

Product designed in inches.

Metric conversions provided for reference only.

### RESOLVER OPTION

A frameless resolver is available to provide position feedback computable with a wide variety of CNC and other position loop controllers. This option is required for commutation when using SERVOSTAR or other resolver based controller.

#### RESOLVER SCHEMATIC

#### PHASING EQUATIONS

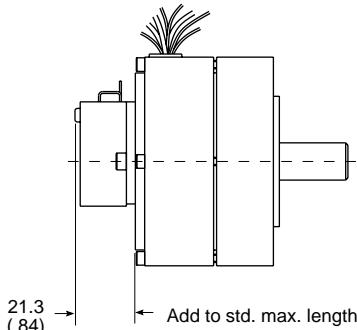

$$E(S1-S3) = KE(R1-R2) \cos \theta$$
$$E(S2-S4) = -KE(R1-R2) \sin \theta$$

WITH CCW ROTATION AS VIEWED FROM SHAFT END

#### NORMAL CHARACTERISTICS AT 25°C

PRIMARY	ROTOR
INPUT VOLTAGE	4.25V, 7 kHz
INPUT CURRENT	55 MA. MAX.
INPUT POWER	0.12 WATTS
TRANSFORMATION RATIO ( $\pm 5\%$ )	0.470
PHASE SHIFT	4° LEADING $\pm 3^\circ$
IMPEDANCES ( $\pm 15\%$ )	
Z <sub>RO</sub>	48 + j70
Z <sub>SO</sub>	62 + j80
Z <sub>SS</sub>	53 + j63
Z <sub>RS</sub>	42 + j55
D.C. RESISTANCE ( $\pm 10\%$ )	
STATOR	33 Ohm
ROTOR	16 Ohm
NUL VOLTAGE	20 MV. MAX.
ELECTRICAL ERROR	$\pm 7$ MINUTES MAX.
OUTPUT VOLTAGE	2.0 V $\pm 5\%$
OPERATING TEMPERATURE	-55° TO +155°C

### ENCODER OPTION

Dimensions in mm (inches).

Product designed in inches.

Metric conversions provided for reference only.

An incremental encoder is available having TTL quadrature and marker pulse outputs. 200 to 2048 lines are available. The standard is 1024 lines with the marker pulse.

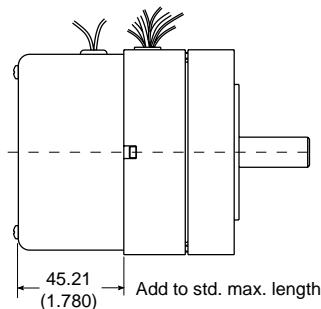

Parameter	Min	Max	Units
Temperature	-40	100	°C
Supply Voltage	4.5	5.5	Volts
Supply Current	30	85	mA
Count Frequency		100	kHz
Velocity		10K	RPM

### BRAKE OPTION

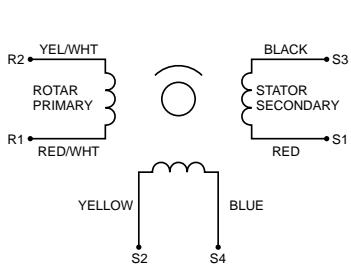

An integral electromagnetic fail-safe brake can be added to the rear of the motor. Operating in the POWER OFF/BRAKE ON mode, the brake provides 240 oz-in of torque for static parking and emergency braking. To release the brake, 24 VDC and 0.30 Amps max need to be applied.

- Fail-safe brake
- 240 oz-in holding torque
- Release voltage of 24 VDC (0.30 Amps)

Dimensions in mm (inches).

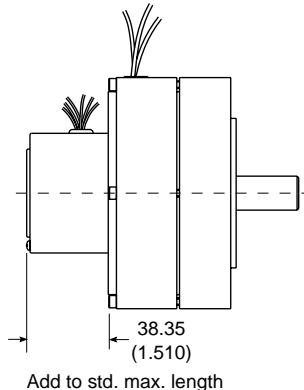

Product designed in inches.

Metric conversions provided for reference only.

## BRAKE OPTION

An integral electromagnetic fail-safe brake can be added to the rear of the motor. Operating in the POWER OFF/BRAKE ON mode, the brake provides 4.2 lb-ft of torque for static parking and emergency braking. To release the brake, 24 VDC and 0.39 Amps max need to be applied.

- Fail-safe brake
- 4.2 lb-ft holding torque
- Release voltage of 24 VDC (0.39 Amps)
